

æve

product world / packaging / ritual / interface

MASTER STORYBOARD V1

A portfolio sequence assembled from the current image archive. Core work, supporting assets, research extensions, and production actions remain distinct so the study can expand without being flattened.

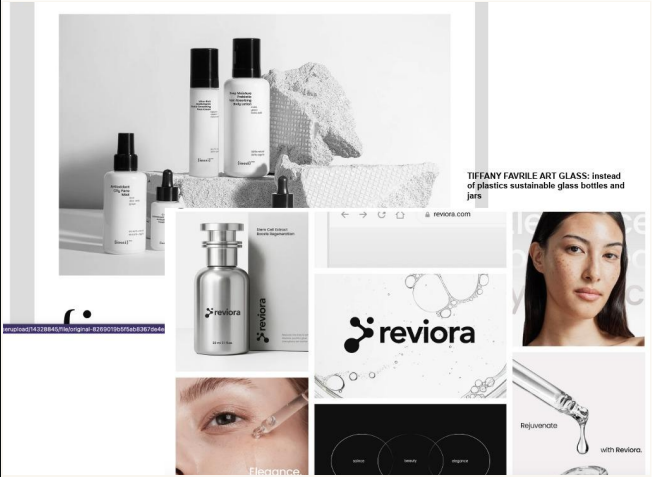

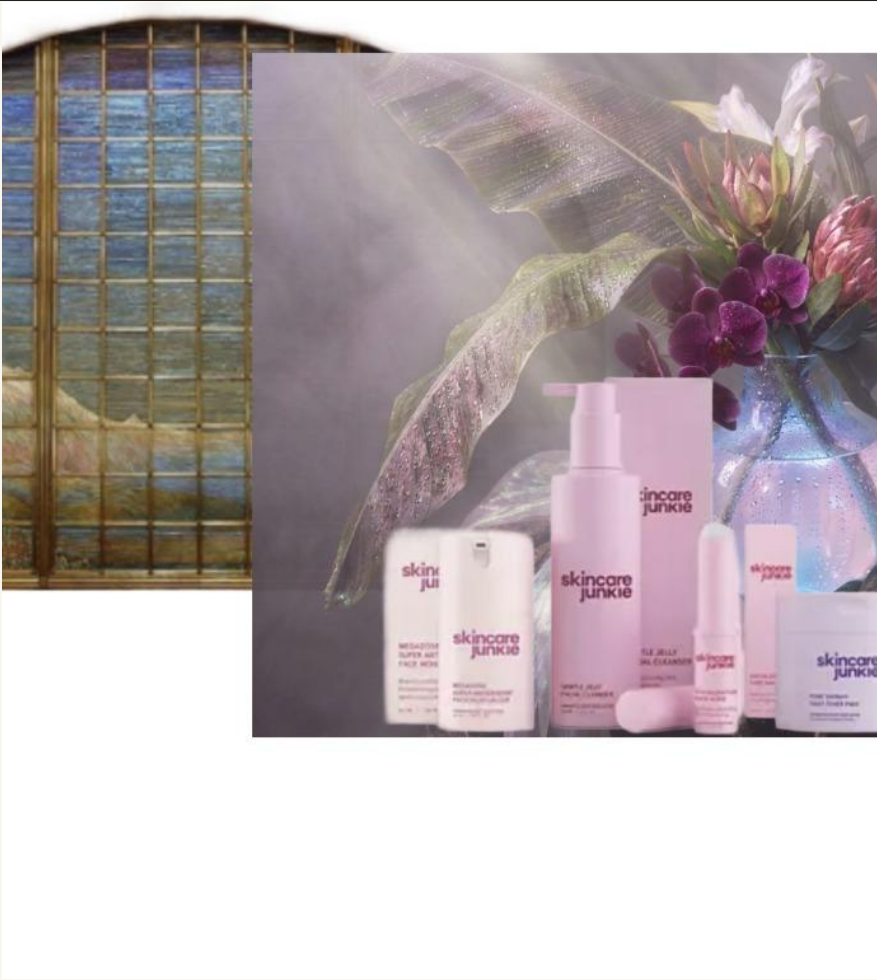

STUDY PREMISE

The body as a lived surface.

æve develops a skincare world through weight, moisture, residue, reflection, and touch. Brushed metal, iridescent glass, wet stone, shells, pearls, steam, and raw butter textures move across packaging, campaign imagery, and interface.

This sequence preserves complexity. It does not treat the study as a single mockup or reduce the archive to one visual category.

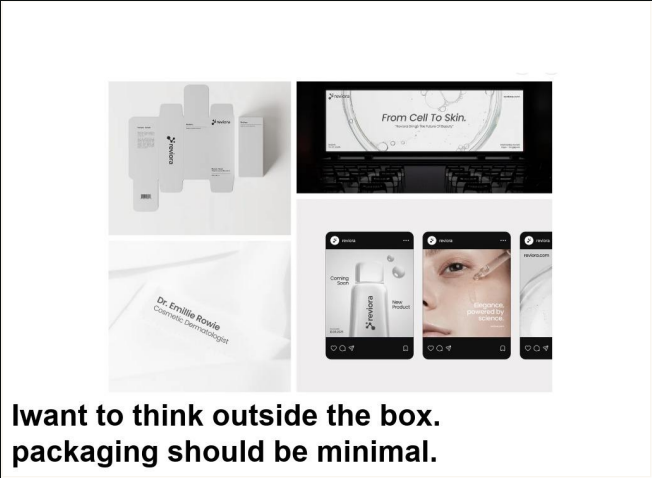

A material vocabulary,
not a category imitation.

The early archive links stained glass,
prismatic art glass, skincare packaging,
object still life, restraint, and interface
studies.

Internal reference boards remain in the development archive.
Public reuse requires source and rights review.

I want to think outside the box.
packaging should be minimal.

MATERIAL SYSTEM

Protection carries weight.
Moisture carries light.

Oxidized metal, iridescent glass, wet stone, shell, pearl, and refracted light establish the product world before the label is read.

PRODUCT FAMILY

Dense forms. Fluid forms.

The packaging system distinguishes body products from oils and serums through physical form. Jars hold weight. Bottles carry light. The family is cohesive without becoming uniform.

JARS

Metal / mass /
protection

BOTTLES

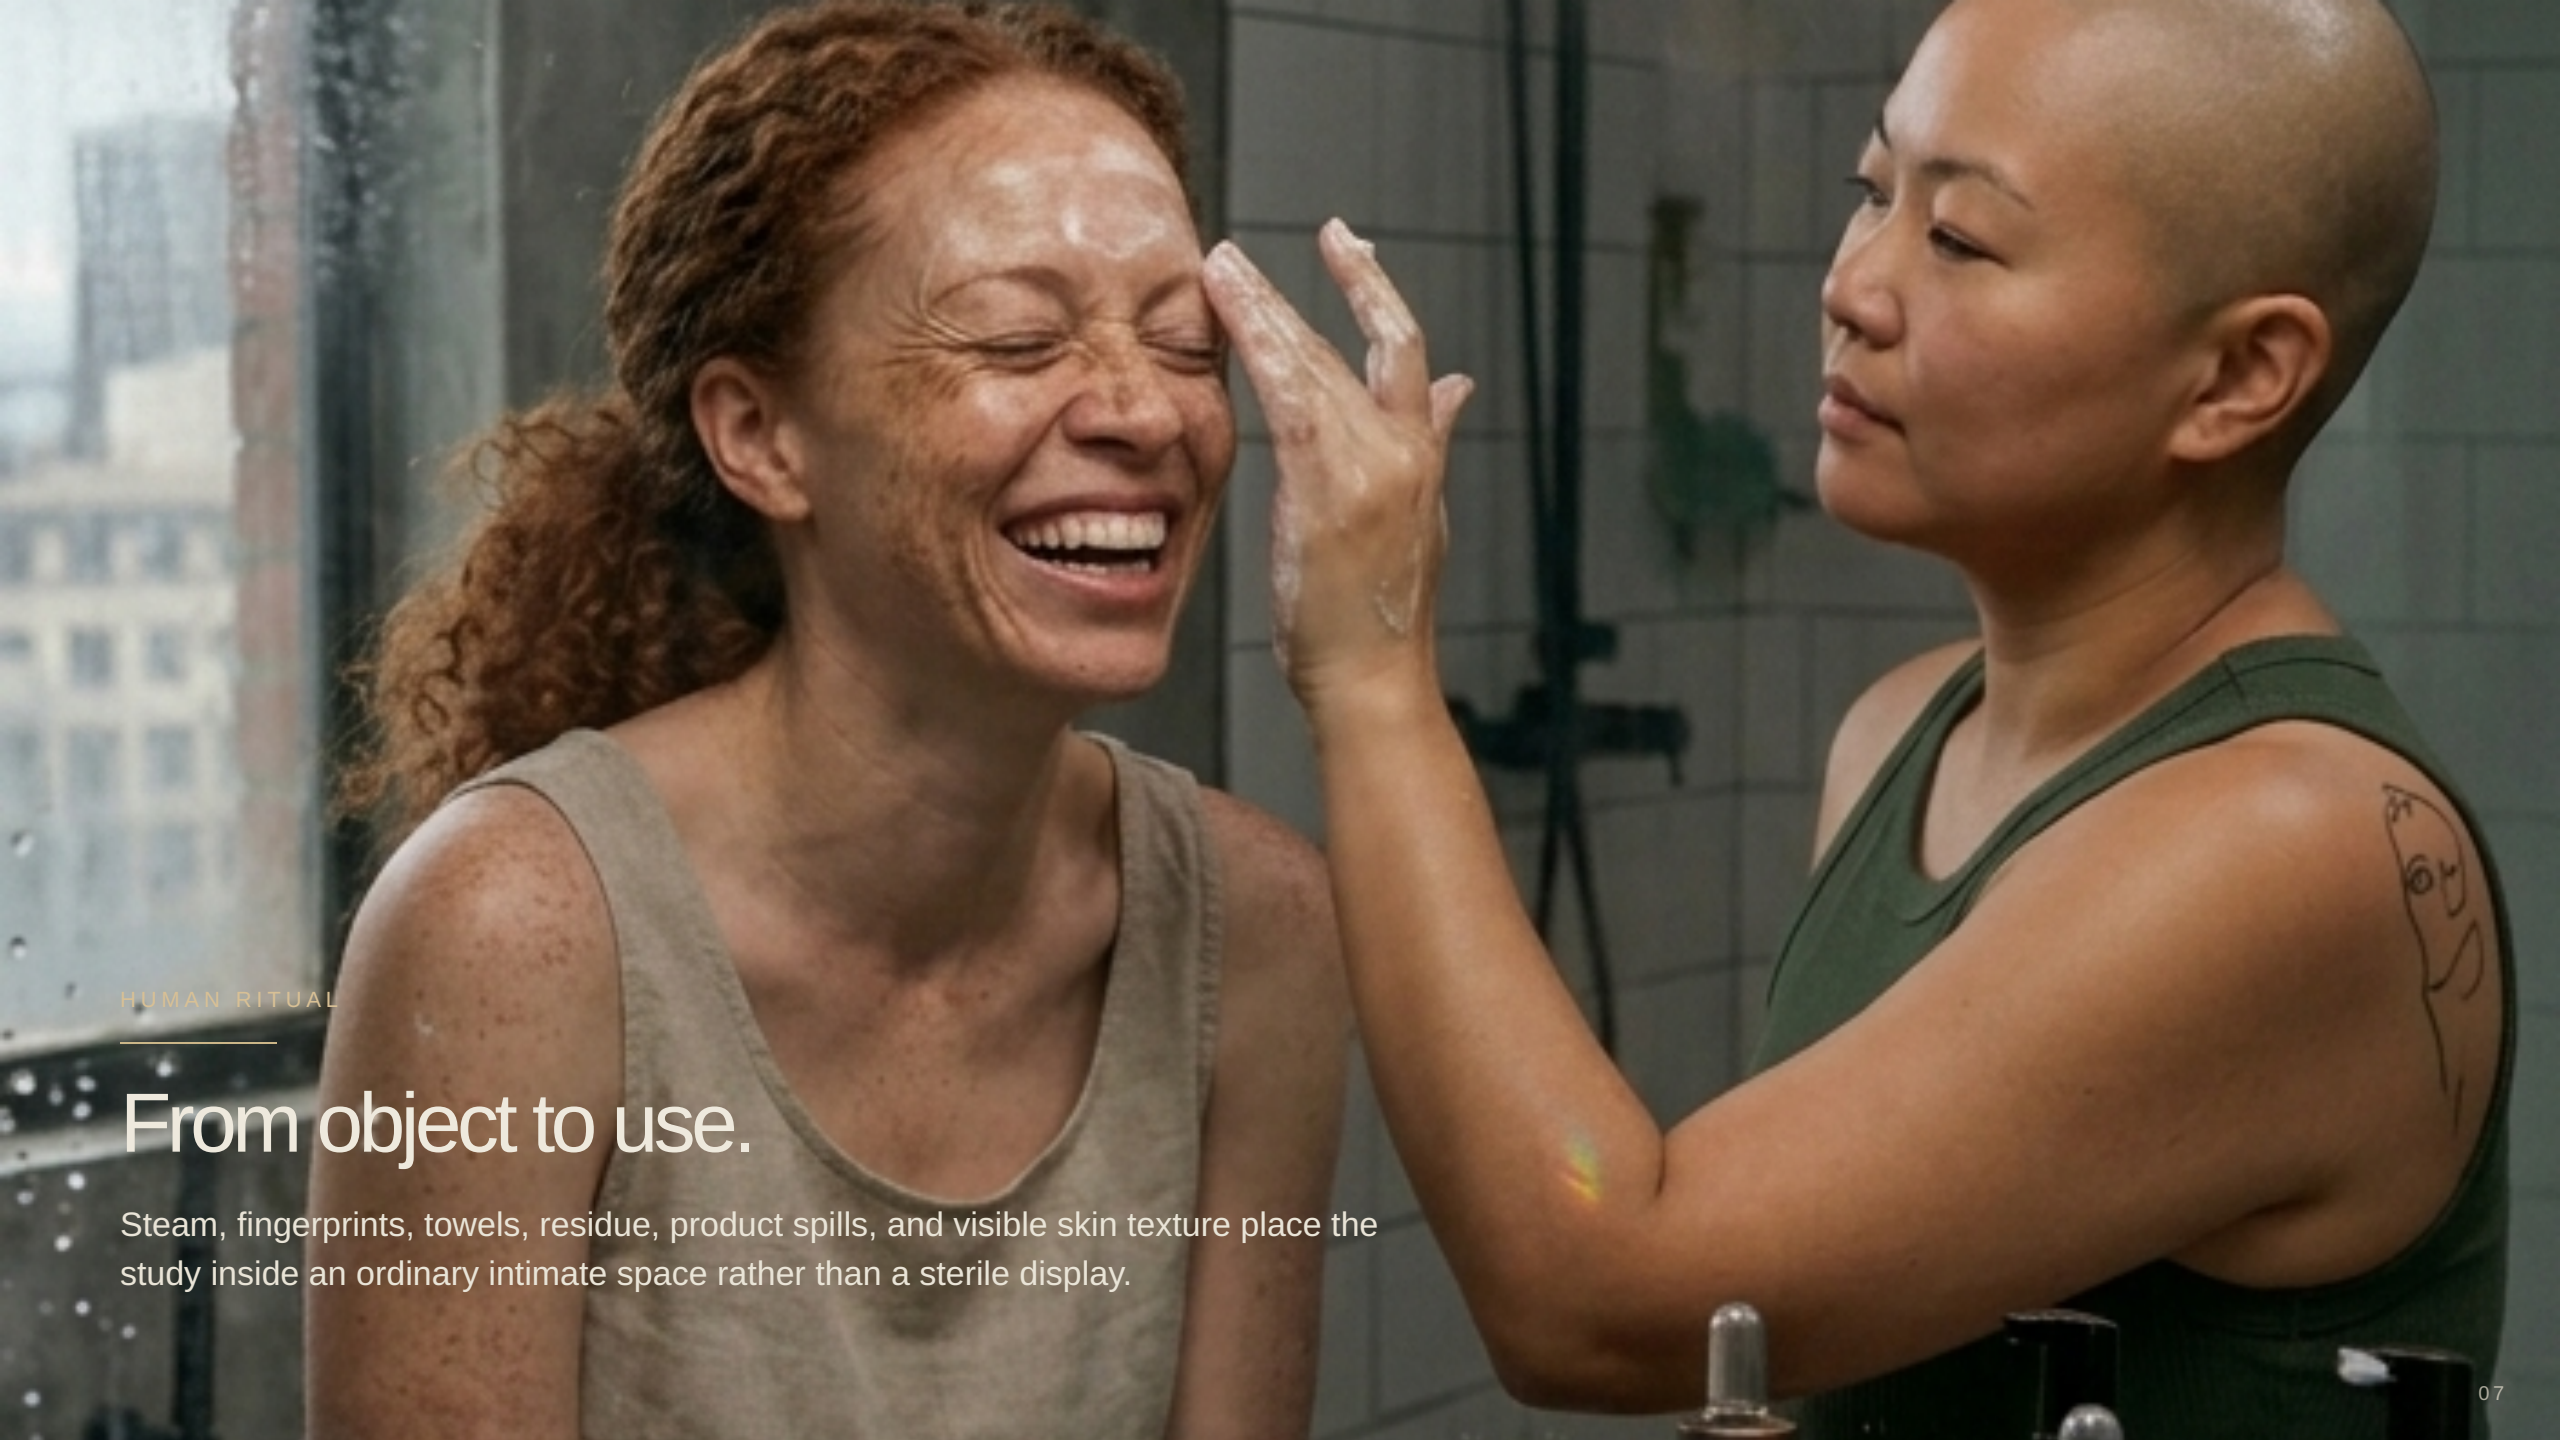

Glass / movement /
reflection

FIELD

Stone / moisture /
residue

Texture is part of the identity.

A photograph of two women in a bathroom. The woman on the left has curly red hair and is laughing with her eyes closed. The woman on the right is bald and is applying a white cream to the forehead of the first woman. The background shows a window with a city view and a tiled wall.

HUMAN RITUAL

From object to use.

Steam, fingerprints, towels, residue, product spills, and visible skin texture place the study inside an ordinary intimate space rather than a sterile display.

 memory

The physical logic moves into interface.

Dark surfaces, layered bubbles, glass panels, restrained navigation, and calm information states retain the sensory world in a mobile environment.

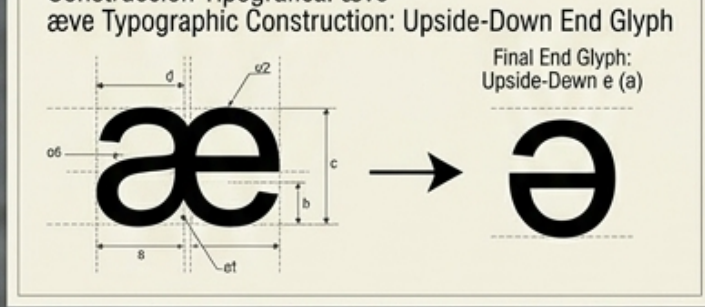

HARVESTED

WORDMARK / CONSTRUCTION STUDY

Typography enters as structure.

The current archive includes wordmark, spacing, label, and terminal-glyph experiments. The public version should retain the authored construction process while replacing generated diagrams with a final vector build.

Status: preserve the exploration. Rebuild the final wordmark construction as vector before publication.

RESEARCH-LED VISUAL EXTENSION

The molecular renders are retained as concept experiments. Replace them with a verified diagram before presenting them as scientific information.

Documented reference layer.

FAVRILE + IRIDESCENT GLASS

Public wording can accurately identify Favrile and iridescent art-glass references as part of the bottle direction. The Met identifies Louis C. Tiffany vessels as Favrile glass. Corning documents iridescence as a deliberate glass effect.

Metropolitan Museum of Art - Tiffany Favrile vase
Corning Museum of Glass - Iridescence

COSMETIC-LABEL COPY

FDA distinguishes cosmetics from products presented with claims to treat disease or affect bodily structure or function. Review effect language before commercial use.

FDA - Cosmetics Labeling Claims
FDA - Cosmetics & U.S. Law

THYMOQUINONE

PubChem identifies thymoquinone with molecular formula C10H12O2. Current renders remain visual experiments until replaced with a verified structure diagram.

PubChem - Thymoquinone CID 10281

ARCHIVE RULE

Nothing is deleted. Public sequence, process archive, reference boards, and extended directions remain separate so the study can expand without being mistaken for a single locked product system.

æve

a sensory system in progress

Master storyboard assembled from the first development archive. The production register identifies the next concrete rebuild pass.
